Interpolation Example

x	$\sin x$
30°	0.5
31°	0.515038
32°	0.529919

$$\sin 30.5^\circ = ?$$

©Sharif University Of Technology

Interpolation Example

x	$\sin x$
30°	0.5
31°	0.515038
32°	0.529919

$$\sin 30.5^\circ = \frac{0.5 + 0.515038}{2} = 0.507519$$

©Sharif University Of Technology

Why Interpolation ?

Hundreds of years ago, when there was not any computer, people manually calculated the value of functions such as sinus at certain points like 30° and 31° and then used interpolation methods to calculate its values at intermediate points.

©Sharif University Of Technology

Why Interpolation ?

Hundreds of years ago, when there was not any computer, people manually calculated the value of functions such as sinus at certain points like 30° and 31° and then used interpolation methods to calculate its values at intermediate points.

- We have several points and we need a function that passes through all of them.
- We have a function with a strange form and we need a fairly accurate polynomial approximation for it.

Curve Fitting

©Sharif University Of Technology

Interpolation

Definition: If we have $n+1$ distinct points (x_0 to x_n) from $f(x)$, interpolation polynomial is a polynomial at most from n degree that passes through all these points.

$$\boldsymbol{P_n(x_i) = f(x_i)}$$

- Increasing the number of points does not necessarily reduce the error!

©Sharif University Of Technology

Interpolation

Examples of interpolating polynomials:
(*a*) first-order (linear) connecting two points,
(*b*) second-order (quadratic or parabolic) connecting three points,
(*c*) third-order (cubic) connecting four points.

©Sharif University Of Technology

Runge's phenomenon

higher degrees does not always improve accuracy!

$$f(x) = \frac{1}{1 + 25x^2}$$

The red curve is the Runge function.
The blue curve is a 5th-order interpolating polynomial (using six equally spaced interpolating points).
The green curve is a 9th-order interpolating polynomial (using ten equally spaced interpolating points).

©Sharif University Of Technology

Runge's phenomenon

©Sharif University Of Technology

Runge's phenomenon

©Sharif University Of Technology

Interpolation

Actually we want to find $P_n(x)$ that is an approximation for $f(x)$ and $n+1$ points are used to calculate it.

$$P_n(x) = a_0 + a_1 x + a_2 x^2 + \cdots + a_n x^n$$

$P_n(x)$ must be passed through all of this $n+1$ points, so we have $n+1$ equations for $n+1$ unknowns.

$$\begin{cases} f(x_0) = a_0 + a_1 x_0 + a_2 {x_0}^2 + \cdots + a_n {x_0}^n \\ f(x_1) = a_0 + a_1 x_1 + a_2 {x_1}^2 + \cdots + a_n {x_1}^n \\ \cdots \\ f(x_n) = a_0 + a_1 x_n + a_2 {x_n}^2 + \cdots + a_n {x_n}^n \end{cases}$$

These equations have a unique answer for a_0 to a_n.

©Sharif University Of Technology

Interpolation

When we have $\forall i\ x_i - x_{i-1} = x_{i+1} - x_i$, then we use Newton forward, backward or central differences method and in other cases, we use other methods, such as Lagrange method or Newton divided differences method.

Lagrange Method

$$P_n(x) = \sum_{i=0}^{n} f(x_i) l_i(x)$$

©Sharif University Of Technology

Lagrange Method

$$P_n(x) = \sum_{i=0}^{n} f(x_i) l_i(x)$$

$$l_i(x) = \prod_{\substack{j=0 \\ j \neq i}}^{n} \left(\frac{x - x_j}{x_i - x_j} \right) =$$

$$= \frac{(x - x_0)(x - x_1) \dots (x - x_{i-1})(x - x_{i+1}) \dots (x - x_n)}{(x_i - x_0)(x_i - x_1) \dots (x_i - x_{i-1})(x_i - x_{i+1}) \dots (x_i - x_n)}$$

©Sharif University Of Technology

Lagrange Method

Example: find $f(2.5)$.

x_i	0	1	2	3	5
$f(x_i)$	-3	0	5	12	32

©Sharif University Of Technology

Lagrange Method

Example: find $f(2.5)$.

x_i	0	1	2	3	5
$f(x_i)$	-3	0	5	12	32

Solution:

$$L_0(x) = \frac{(x-1)(x-2)(x-3)(x-5)}{(0-1)(0-2)(0-3)(0-5)}$$

$$L_1(x) = \frac{(x-0)(x-2)(x-3)(x-5)}{(1-0)(1-2)(1-3)(1-5)}$$

$$L_2(x) = \frac{(x-0)(x-1)(x-3)(x-5)}{(2-0)(2-1)(2-3)(2-5)}$$

$$L_3(x) = \frac{(x-0)(x-1)(x-2)(x-5)}{(3-0)(3-1)(3-2)(3-5)}$$

$$L_4(x) = \frac{(x-0)(x-1)(x-2)(x-3)}{(5-0)(5-1)(5-2)(5-3)}$$

©Sharif University Of Technology

Lagrange Method

Example: find $f(2.5)$.

x_i	0	1	2	3	5
$f(x_i)$	-3	0	5	12	32

Solution:

$$L_0(x) = \frac{(x-1)(x-2)(x-3)(x-5)}{(0-1)(0-2)(0-3)(0-5)}$$

$$L_1(x) = \frac{(x-0)(x-2)(x-3)(x-5)}{(1-0)(1-2)(1-3)(1-5)}$$

$$L_2(x) = \frac{(x-0)(x-1)(x-3)(x-5)}{(2-0)(2-1)(2-3)(2-5)}$$

$$L_3(x) = \frac{(x-0)(x-1)(x-2)(x-5)}{(3-0)(3-1)(3-2)(3-5)}$$

$$L_4(x) = \frac{(x-0)(x-1)(x-2)(x-3)}{(5-0)(5-1)(5-2)(5-3)}$$

$$P_4(x) = -3L_0(x) + 0L_1(x) + 5L_2(x) + 12L_3(x) + 32L_4(x)$$

$$P_4(x) = x^2 + 2x - 3 \rightarrow f(2.5) = P(2.5) = 8.25$$

©Sharif University Of Technology

Lagrange Method

- Selecting different x_is results in different interpolated polynomials.

Cons:

1. It's fairly hard and time-consuming to calculate $l_i(x)$s.

2. We can not understand the degree of interpolation polynomial from degree of $l_i(x)$s.

3. It is not a stable method and it is completely dependent on x_is. Plus, if we want to add an x_i, we must redo all calculations from the beginning.

©Sharif University Of Technology

Lagrange Method

Error of method:

$$\varepsilon_n = f(x) - P_n(x) \leq (x - x_0)(x - x_1) \dots (x - x_n)\frac{f^{n+1}(t)}{(n+1)!}$$

$$x_0 \leq t \leq x_n \quad | \quad t = maximize \quad |f^{n+1}(x_i)|$$

©Sharif University Of Technology

An Example

- Compute the value of $\sqrt{115}$ using Lagrange method.
- What's the maximum error in calculating $\sqrt{115}$?

©Sharif University Of Technology

An Example

- Compute the value of $\sqrt{115}$ using Lagrange method.
- What's the maximum error in calculating $\sqrt{115}$?

Solution:

$$f(x) = \sqrt{x}$$

x_i	100	121	144
$\sqrt{x_i}$	10	11	12

$$L_0(x) = \frac{(x-121)(x-144)}{(100-121)(100-144)} \qquad L_1(x) = \frac{(x-100)(x-144)}{(121-100)(121-144)}$$

$$L_2(x) = \frac{(x-100)(x-121)}{(144-100)(144-121)}$$

$$P_2(x) = 10L_0(x) + 11L_1(x) + 12L_2(x)$$

$$\Longrightarrow f(115) = P_2(115) = 10.7228$$

©Sharif University Of Technology

An Example

- Compute the value of $\sqrt{115}$ using Lagrange method.
- What's the maximum error in calculating $\sqrt{115}$?

Solution:

$$f(x) = \sqrt{x}$$

x_i	100	121	144
$\sqrt{x_i}$	10	11	12

$$\varepsilon_n \leq (x - x_0)(x - x_1)(x - x_2)\left(\frac{F^{(n+1)}(t)}{(n+1)!}\right)$$

$$f(x) = \sqrt{x} \rightarrow f'(x) = \frac{1}{2}x^{-\frac{1}{2}} \rightarrow f''(x) = -\frac{1}{4}x^{-\frac{3}{2}} \rightarrow f^{(3)}(x) = \frac{3}{8}x^{-\frac{5}{2}}$$

$$\varepsilon_2 \leq (115 - 100)(115 - 121)(115 - 144)\left(\frac{\frac{3}{8}(100)^{-\frac{5}{2}}}{(2+1)!}\right) \rightarrow \varepsilon_2 \leq 0.00163$$

©Sharif University Of Technology

An Example

- Compute the value of $\sqrt{115}$ using Lagrange method.
- What's the maximum error in calculating $\sqrt{115}$?

Solution:

$$f(x) = \sqrt{x}$$

x_i	100	121	144
$\sqrt{x_i}$	10	11	12

$$\varepsilon_2 \leq (115-100)(115-121)(115-144)\left(\frac{\frac{3}{8}(100)^{-\frac{5}{2}}}{(2+1)!}\right) \rightarrow \varepsilon_2 \leq 0.00163$$ **(upper bound)**

$\sqrt{115}$=10.7238,
$f(115) = P_2(115) = 10.7228,$
10.7238 - 10.7228 = 0.001 **(Real error)**

Newton Divided Differences Method

Newton's form of the interpolation polynomial is:

$$P_n(x) = a_0 + a_1(x - x_0) + a_2(x - x_0)(x - x_1) + \cdots + a_n(x - x_0)(x - x_1) \ldots (x - x_{n-1})$$

©Sharif University Of Technology

Newton Divided Differences Method

Divided differences are :

$$f[x_k] = f(x_k)$$

$$f[x_k, x_{k+1}] = \frac{f[x_{k+1}] - f[x_k]}{x_{k+1} - x_k}$$

$$f[x_k, x_{k+1}, x_{k+2}] = \frac{f[x_{k+1}, x_{k+2}] - f[x_k\,, x_{k+1}]}{x_{k+2} - x_k}$$

$$f\left[x_k, x_{k+1}, \dots, x_{k+j}\right] = \frac{f\left[x_{k+1}, \dots, x_{k+j}\right] - f\left[x_k\,, \dots, x_{k+j-1}\right]}{x_{k+j} - x_k}$$

Newton Divided Differences Method

$$P_n(x) = a_0 + a_1(x - x_0) + a_2(x - x_0)(x - x_1) + \cdots + a_n(x - x_0)(x - x_1) \ldots (x - x_{n-1})$$

This method has solved problems of Lagrange method:

Error of method:

$$\varepsilon_n = f(x) - P_n(x) \leq (x - x_0)(x - x_1) \ldots (x - x_n)\frac{f^{n+1}(t)}{(n+1)!}$$

$$x_0 \leq t \leq x_n \quad | \quad t = maximize \quad |f^{n+1}(x_i)|$$

©Sharif University Of Technology

Newton Divided Differences Method

- The degree of interpolation polynomial is clarified when values in a column of the table become equal (so values in next column will be 0).
- With adding a x_i, only one row will be added to the table.
- Calculations are much simpler.

©Sharif University Of Technology

Newton Divided Differences Method

Example:

x_i	1	2	3	4	5
$f(x_i)$	-3	0	15	48	105

Newton Forward, Central and Backward Differences Methods

- If interpolated point is close to x_0, we use forward differences.
- If it is close to x_n, we use backward differences.
- If it is in the middle of points, we use central differences method.

©Sharif University Of Technology

An Example

Calculate the forward, backward and central differences of $f(0.25)$ and $f(0.35)$ according to following data.

x_i	0.1	0.2	0.3	0.4	0.5
$f(x_i)$	1.4	1.56	1.76	2	2.28

©Sharif University Of Technology

An Example

Calculate the forward, backward and central differences of $f(0.25)$ *and* $f(0.35)$ according to following data.

x_i	0.1	0.2	0.3	0.4	0.5
$f(x_i)$	1.4	1.56	1.76	2	2.28

Solution:

x_i	$f(x_i)$	1st order	2nd order	3rd order
0.1	1.4			
0.2	1.56	0.16		
0.3	1.76	0.2	0.04	
0.4	2	0.24	0.04	0
0.5	2.28	0.28	0.04	0

©Sharif University Of Technology

$$P_n(x) = f_0 + r\Delta f_0 + \frac{r(r-1)}{2!}\Delta^2 f_0 + \cdots + \frac{r(r-1)\ldots(r-(n-1))}{n!}\Delta^n f_0$$

An Example

x_i	$f(x_i)$	1st order	2nd order	3rd order
0.1	1.4			
0.2	1.56	0.16		
0.3	1.76	0.2	0.04	
0.4	2	0.24	0.04	0
0.5	2.28	0.28	0.04	0

Solution: forward:

$$h = 0.1 \rightarrow x_0 = 0.1 \rightarrow r = \frac{x - 0.1}{0.1}$$

$$P_2(x) = 1.4 + \left(\frac{x-0.1}{0.1}\right)(0.16) + \left(\frac{x-0.1}{0.1}\right)\left(\frac{x-0.1}{0.1} - 1\right)\left(\frac{0.04}{2!}\right)$$

$$= 2x^2 + x + 1.28 \rightarrow \begin{cases} f(0.25) = 1.655 \\ f(0.35) = 1.875 \end{cases}$$

©Sharif University Of Technology

$$P_n(x) = f_n + r\nabla f_n + \frac{r(r+1)}{2!}\nabla^2 f_n + \cdots + \frac{r(r+1)\ldots(r+n-1)}{n!}\nabla^n f_n$$

An Example

x_i	$f(x_i)$	1st order	2nd order	3rd order
0.1	1.4			
0.2	1.56	0.16		
0.3	1.76	0.2	0.04	
0.4	2	0.24	0.04	0
0.5	2.28	0.28	0.04	0

Solution: backward:

$$h = 0.1 \rightarrow x_n = 0.5 \rightarrow r = \frac{x - 0.5}{0.1}$$

$$P_2(x) = 2.28 + \left(\frac{x-0.5}{0.1}\right)(0.28) + \left(\frac{x-0.5}{0.1}\right)\left(\frac{x-0.5}{0.1} + 1\right)\left(\frac{0.04}{2!}\right)$$

$$= 2x^2 + x + 1.28 \rightarrow \begin{cases} f(0.25) = 1.655 \\ f(0.35) = 1.875 \end{cases}$$

©Sharif University Of Technology

$$P_n(x) = f_{\frac{n}{2}} + r\delta f_{\frac{n+1}{2}} + \frac{r(r-1)}{2!}\delta^2 f_{\frac{n}{2}} + \frac{r(r-1)(r+1)}{3!}\delta^3 f_{\frac{n+1}{2}} + \cdots + \frac{r(r-1)(r+1)(r-2)(r+2)\ldots\left(r-\left(\frac{n}{2}-1\right)\left(r+\left(\frac{n}{2}-1\right)\right)\right)}{n!}\delta^n f_{\frac{n}{2}}$$

An Example

x_i	$f(x_i)$	1st order	2nd order	3rd order
0.1	1.4			
0.2	1.56	0.16		
0.3	1.76	0.2	0.04	
0.4	2	0.24	0.04	0
0.5	2.28	0.28	0.04	0

Solution: forward central:

$$h = 0.1 \rightarrow x_{\frac{n}{2}} = 0.3 \rightarrow r = \frac{x-0.3}{0.1}$$

$$P_2(x) = 1.76 + \left(\frac{x-0.3}{0.1}\right)(0.24) + \left(\frac{x-0.3}{0.1}\right)\left(\frac{x-0.3}{0.1}-1\right)\left(\frac{0.04}{2!}\right)$$

$$= 2x^2 + x + 1.28 \rightarrow \begin{cases} f(0.25) = 1.655 \\ f(0.35) = 1.875 \end{cases}$$

©Sharif University Of Technology

$$P_n(x) = f_{\frac{n}{2}} + r\delta f_{\frac{n-1}{2}} + \frac{r(r+1)}{2!}\delta^2 f_{\frac{n}{2}} + \frac{r(r+1)(r-1)}{3!}\delta^3 f_{\frac{n-1}{2}} + \cdots + \frac{r(r+1)(r-1)(r+2)(r-2)\ldots(r+\left(\frac{n}{2}-1\right)(r-\left(\frac{n}{2}-1\right))}{n!}\delta^n f_{\frac{n}{2}}$$

An Example

x_i	$f(x_i)$	1st order	2nd order	3rd order
0.1	1.4			
0.2	1.56	0.16		
0.3	1.76	0.2	0.04	
0.4	2	0.24	0.04	0
0.5	2.28	0.28	0.04	0

Solution: backward central:

$$h = 0.1 \rightarrow x_{\frac{n}{2}} = 0.3 \rightarrow r = \frac{x-0.3}{0.1}$$

$$P_2(x) = 1.76 + \left(\frac{x-0.3}{0.1}\right)(0.2) + \left(\frac{x-0.3}{0.1}\right)\left(\frac{x-0.3}{0.1}+1\right)\left(\frac{0.04}{2!}\right)$$

$$= 2x^2 + x + 1.28 \rightarrow \begin{cases} f(0.25) = 1.655 \\ f(0.35) = 1.875 \end{cases}$$

©Sharif University Of Technology

Extrapolation

Extrapolation is similar to interpolation, but in extrapolation, value of the point that we want to calculate is located outside the set of known data points (Error may be high here).

We can use all interpolation methods for extrapolation.

©Sharif University Of Technology

Interpolation

Extrapolation

Curve Fitting

- Fit to Polynomials
- Some curves
- Fit to Other Functions with and without Linearization

©Sharif University Of Technology

Curve Fitting

Curve fitting is the process of constructing a curve or a mathematical function that has the best fit to a series of data points.

$$S_{x^0} = \sum_{i=0}^{n} x_i^0 = n+1 \ , S_{x^1} = \sum_{i=0}^{n} x_i^1 \ \ , S_{x^2} = \sum_{i=0}^{n} {x_i}^2 \ , S_{x^k y} = \sum_{i=0}^{n} {x_i}^k y_i$$

©Sharif University Of Technology

Least Squares Fit

Suppose that $\boldsymbol{m} = \mathbf{1}$, so we will have linear fit:

$$\begin{cases} a_0(n+1) + a_1\left(\sum_{i=0}^{n} x_i\right) = \sum_{i=0}^{n} y_i \\ a_0\left(\sum_{i=0}^{n} x_i\right) + a_1\left(\sum_{i=0}^{n} {x_i}^2\right) = \sum_{i=0}^{n} x_i y_i \end{cases}$$

$$\boxed{P_1(x) = a_0 + a_1 x}$$

©Sharif University Of Technology

Least Squares Fit

Suppose that $\boldsymbol{m} = \mathbf{2}$, so we will have:

$$\begin{cases} a_0(n+1) + a_1\left(\sum_{i=0}^{n} x_i\right) + a_2\left(\sum_{i=0}^{n} {x_i}^2\right) = \sum_{i=0}^{n} y_i \\ a_0\left(\sum_{i=0}^{n} x_i\right) + a_1\left(\sum_{i=0}^{n} {x_i}^2\right) + a_2\left(\sum_{i=0}^{n} {x_i}^3\right) = \sum_{i=0}^{n} x_i y_i \\ a_0\left(\sum_{i=0}^{n} {x_i}^2\right) + a_1\left(\sum_{i=0}^{n} {x_i}^3\right) + a_2\left(\sum_{i=0}^{n} {x_i}^4\right) = \sum_{i=0}^{n} {x_i}^2 y_i \end{cases}$$

$$P_2\,(x) = a_0 + a_1 x + a_2 x^2$$

Exponential Fit

$$\boldsymbol{y} = ae^{bx}$$

©Sharif University Of Technology

Exponential Fit

$$\boldsymbol{y} = ae^{bx} \quad \rightarrow \ln y = \ln a + bx$$

©Sharif University Of Technology

Exponential Fit

$$\boldsymbol{y} = ae^{bx} \rightarrow \underbrace{\ln y}_{Y} = \underbrace{\ln a}_{a_0} + \underbrace{b}_{a_1}\underbrace{x}_{X}$$

©Sharif University Of Technology

An Example

Fit the best exponential curve (ae^{bx}) to the tabular data below:

x_i	0	1	2
y_i	1	2	6

Solution:

$$y = ae^{bx} \quad \Rightarrow lny = lna + bx$$

$$Y = a_0 + a_1 X \implies \begin{cases} Y = lny \\ a_0 = lna \\ a_1 = b \\ X = x \end{cases}$$

©Sharif University Of Technology

$$\begin{cases} a_0(n+1) + a_1\left(\sum_{i=0}^{n} x_i\right) = \sum_{i=0}^{n} y_i \\ a_0\left(\sum_{i=0}^{n} x_i\right) + a_1\left(\sum_{i=0}^{n} {x_i}^2\right) = \sum_{i=0}^{n} x_i y_i \end{cases}$$

An Example

x_i	y_i	$X_i = x_i$	$Y_i = lny_i$	X_i^2	X_iY_i
0	1	0	0	0	0
1	2	1	0.69	1	0.69
2	6	2	1.79	4	3.58
		$S_X = \mathbf{3}$	$S_Y = \mathbf{2.48}$	$S_{X^2} = \mathbf{5}$	$S_{XY} = \mathbf{4.27}$

©Sharif University Of Technology

$$\begin{cases} a_0(n+1) + a_1\left(\sum_{i=0}^{n} x_i\right) = \sum_{i=0}^{n} y_i \\ a_0\left(\sum_{i=0}^{n} x_i\right) + a_1\left(\sum_{i=0}^{n} {x_i}^2\right) = \sum_{i=0}^{n} x_i y_i \end{cases}$$

An Example

x_i	y_i	$X_i = x_i$	$Y_i = lny_i$	X_i^2	X_iY_i
0	1	0	0	0	0
1	2	1	0.69	1	0.69
2	6	2	1.79	4	3.58
		$S_X = 3$	$S_Y = 2.48$	$S_{X^2} = 5$	$S_{XY} = 4.27$

$$\Rightarrow \begin{cases} 3a_0 + 3a_1 = 2.48 \\ 3a_0 + 5a_1 = 4.27 \end{cases} \Rightarrow \begin{cases} a_0 = -0.07 \\ a_1 = 0.9 \end{cases}$$

$$Y = a_0 + a_1 X \quad \Rightarrow \begin{cases} Y = lny \\ a_0 = lna \\ a_1 = b \\ X = x \end{cases}$$

$$\Rightarrow \begin{cases} b = a_1 = 0.9 \\ a = e^{a_0} = e^{-0.07} = 0.93 \end{cases} \Rightarrow y = 0.93e^{0.9x}$$

©Sharif University Of Technology

Linearization

$$y = \alpha a^{\beta x} \rightarrow \log_a y = log_a^{\alpha} + \beta x$$

Y a_0 a_1 X

©Sharif University Of Technology

Linearization

$$y = a \ln x + b$$

$y \to Y$, $a \to a_1$, $\ln x \to X$, $b \to a_0$

©Sharif University Of Technology

Linearization

$$y = \frac{a}{x} + b$$

$$\rightarrow \underbrace{y}_{Y} = \underbrace{a}_{a_1} \times \underbrace{\frac{1}{x}}_{X} + \underbrace{b}_{a_0}$$

©Sharif University Of Technology

Linearization

$$y = \frac{1}{ax + b}$$

$$\rightarrow \underbrace{\frac{1}{y}}_{Y} = \underbrace{a}_{a_1}\underbrace{x}_{X} + \underbrace{b}_{a_0}$$

©Sharif University Of Technology

Linearization

$$y = \frac{1}{(ax+b)^2}$$

$$\rightarrow \frac{1}{y} = (ax+b)^2$$

$$\rightarrow \underbrace{\sqrt{\frac{1}{y}}}_{Y} = \underbrace{a}_{a_1}\underbrace{x}_{X} + \underbrace{b}_{a_0}$$

©Sharif University Of Technology

Least Squares Fit

$$F(x) = a_0 f_0 + a_1 f_1 + a_2 f_2 + \cdots + a_n f_n$$

$$\mathrm{E} = \sum_{i=1}^{n} [y_i - F(x_i)]^2$$

$$\frac{\partial E}{\partial a_i} = 0 \quad i = 0,1,\ldots,m$$

©Sharif University Of Technology

Least Squares Fit

$$\begin{bmatrix} \sum_{i=1}^{m} f_0 f_0 & \sum_{i=1}^{m} f_0 f_1 & \cdots & \sum_{i=1}^{m} f_0 f_n \\ \sum_{i=1}^{m} f_1 f_0 & \sum_{i=1}^{m} f_1 f_1 & \cdots & \sum_{i=1}^{m} f_1 f_n \\ \vdots & \vdots & & \vdots \\ \sum_{i=1}^{m} f_n f_0 & \sum_{i=1}^{m} f_n f_1 & \cdots & \sum_{i=1}^{m} f_n f_n \end{bmatrix} \begin{bmatrix} a_0 \\ a_1 \\ \vdots \\ a_n \end{bmatrix} = \begin{bmatrix} \sum_{i=1}^{m} f_0 y_i \\ \sum_{i=1}^{m} f_1 y_i \\ \vdots \\ \sum_{i=1}^{m} f_n y_i \end{bmatrix}$$

©Sharif University Of Technology

با استفاده از داده‌های جدولی زیر یک تابع به صورت $g(x) = aSinx + bCosx$ به روش کمترین مربعات برازش کنید.

x_i	۰/۰۵	۰/۱	۰/۱۵	۰/۲۰
f_i	۰/۵۲۹۴	۰/۹۴۱۵	۱/۱۴۷۵	۱/۱۰۹۳

حل

$$y = aSinx + bCosx \Rightarrow D = \sum (y - aSinx - bCosx)^۲$$

$$\begin{cases} \dfrac{\partial D}{\partial a} = ۰ \Rightarrow -۲\sum Sinx(y - aSinx - bCosx) = ۰ \Rightarrow \sum ySinx - \sum aSin^۲x - \sum bSinxCosx = ۰ \\ \dfrac{\partial D}{\partial b} = ۰ \Rightarrow -۲\sum Cosx(y - aSinx - bCosx) = ۰ \Rightarrow \sum yCosx - \sum aSinxCosx - \sum bCos^۲x = ۰ \end{cases}$$

$$\Rightarrow \begin{cases} a\sum Sin^۲x + b\sum SinxCosx = \sum ySinx \\ a\sum SinxCosx + b\sum Cos^۲x = \sum yCosx \end{cases}$$

اکنون جدول زیر را تشکیل می‌دهیم:

	x_i	y_i	$Sin^۲x_i$	$Sinx_iCosx_i$	$Cos^۲x_i$	y_iSinx_i	y_iCosx_i
	۰/۰۵	۰/۵۲۹۴	۰/۰۰۲۵	۰/۰۴۹۹	۰/۹۹۷۵	۰/۰۲۶۵	۰/۵۲۸۷
	۰/۱	۰/۹۴۱۵	۰/۰۱۰۰	۰/۰۹۹۳	۰/۹۹۰۰	۰/۰۹۴۰	۰/۹۳۶۸
	۰/۱۵	۱/۱۴۷۵	۰/۰۲۲۳	۰/۱۴۷۸	۰/۹۷۷۷	۰/۱۷۱۵	۱/۱۳۴۶
	۰/۲۰	۱/۱۰۹۳	۰/۰۳۹۵	۰/۱۹۴۷	۰/۹۶۰۵	۰/۲۲۰۴	۱/۰۸۷۲
$\sum$	–	–	۰/۰۷۴۳	۰/۴۹۱۷	۳/۹۲۵۷	۰/۵۱۲۴	۳/۶۸۷۳

حال اعداد به دست آمده را در دستگاه قرار می‌دهیم:

$$\begin{cases} a(۰/۰۷۴۳) + b(۰/۴۹۱۷) = ۰/۵۱۲۴ \\ a(۰/۴۹۱۷) + b(۳/۹۲۵۷) = ۳/۶۸۷۳ \end{cases} \Rightarrow a = ۳/۹۷۶۸,\ b = ۰/۴۴۱۲$$

با قرار دادن در فرم $y = aSinx + bCosx$، خواهیم داشت:

$$y = ۳/۹۷۶۸Sinx + ۰/۴۴۱۲Cosx$$
